Summary

Full-stack software engineer who designed, built, and deployed OVERWATCH, a production operations platform whose code and IP rights were acquired under contract by the company it was built for, now powering daily operations for 40 active users. Strong across full-stack development, cloud infrastructure, data integrations, and LLM-integrated systems in Python, React, FastAPI, and PostgreSQL.

Experience

Software Engineer (OVERWATCH Platform)

Aug 2025 to Present

Strategic Security Corp (platform IP acquired under contract; ongoing engagement)

Smithtown, NY

- Designed and deployed OVERWATCH, a full-stack platform unifying four external systems into a single dashboard, cutting daily operator review time 87% (23 hours to 15 minutes) for 40 active users.
- Built the platform end to end: FastAPI backend, PostgreSQL with SQLAlchemy ORM, and a modular React frontend with 9 operational modules, JWT auth, and multi-tenant architecture.
- Engineered automated REST API and Selenium data pipelines to normalize and surface data from four third-party systems on a schedule, eliminating manual cross-referencing.
- Migrated production from DigitalOcean to Azure with zero data loss, resolving schema mismatches and an integer-overflow edge case across 44,000+ records.
- Built frontend health monitoring against the API that surfaces backend failures in real time, giving immediate visibility into production issues.
- Negotiated and signed a contract transferring the platform's code and IP rights to the organization, which now owns it; continue shipping features and resolving production issues as it anchors daily operations.

Operations Manager / Analyst

Dec 2022 to Present

Strategic Security Corp

Smithtown, NY

- Drove full-company adoption of OVERWATCH across 40 users by leading onboarding, configuring role-based access, and supporting technical and non-technical stakeholders until it replaced all legacy processes.
- Defined the access-control and compliance requirements met in OVERWATCH (RBAC with company-level data isolation, JWT auth, bcrypt hashing, and Pydantic validation) to satisfy federal contract obligations.
- Cut overtime costs 20% by building workforce data models that surfaced staffing inefficiencies, and accelerated executive decisions with automated KPI dashboards.

Projects

Meridian | *Python, FastAPI, PostgreSQL, Celery, Redis, Claude API*

- Built a multi-tenant SaaS platform across three surfaces (FastAPI backend, Next.js dashboard, React Native app) with per-tenant data isolation, subdomains, and plan tiers across roughly 22 domain entities.
- Engineered an autonomous SMS dispatch pipeline using an LLM intent classifier with a safety-first fallback that escalates on malformed output, routing routine requests automatically and critical ones to humans.
- Implemented real-time event delivery via a WebSocket server with Redis pub/sub fan-out, backed by distributed Celery task workers, with a CI/CD pipeline deploying to Azure.

AttendEase | *Kotlin, Firebase, Android SDK, NFC*

- Built an NFC-based mobile attendance app that reduced data entry errors 70%+; led architecture for a 5-person team with zero crashes at final checkpoint.

Technical Skills

Languages: Python, JavaScript, TypeScript, Java, Kotlin, SQL, Swift, Shell

Frameworks: React, Next.js, FastAPI, Node.js, Tailwind CSS, SQLAlchemy

Cloud & Infrastructure: Azure, Docker, Nginx, Git/GitHub, CI/CD

Data & Messaging: PostgreSQL, MySQL, Firebase, Redis, Celery, REST APIs, Selenium

Methodologies: Agile, Scrum, REST API Design **Certifications:** Red Hat Academy (Linux), Coursera (Cybersecurity Foundations)

Education

New York Institute of Technology

Graduated May 2026

B.Sc. in Computer Science
